Privacy at a glance

How Munkki protects what you share in a huddle.

Words you'll see in Munkki

Munkki
The app for sharing everyday moments and making plans together.

A munkki
A short personal message, such as "Thinking of you" or a note you write.

Album
A collection of memories about a trip, person or topic.

Huddle
A shared space in Munkki with its own members and encryption keys.

Memory
A post that can include text, photos, video, voice, files or a place.

Plan
Something you want to do, with or without a date. You can link it to a memory later.

Content is encrypted on your device

When you post a memory or send a munkki, the app encrypts its contents before sending them. Another device needs the matching huddle key to read them. The server stores the encrypted content and uses information such as account IDs, membership and timestamps to run the service.

You choose where it goes. Sharing to more than one huddle creates a separately encrypted copy in each one. Munkki uses group keys, and the server controls access to conversations between two people.

Your device can keep readable copies. Media caches, notification previews and widgets can contain readable information. Saving a file to Photos or sharing it with another app creates a copy outside Munkki.

You can recover access. Use your recovery phrase to open encrypted key backups on a new device, or ask for access from another eligible device when available.

This overview describes the app design reviewed in November 2026.
